

Locking Keys

READ General Instructions FIRST!

TIP: Most pieces fit together without glue. Do a test run first, before gluing.

1

1 The pieces for one key. Each key needs 3 identical pieces and proper amount of little connector plates.

Depending on the version, they are different in length, but always assemble the same way.

Sheets:

Some little connector plates on UV-03

Large: L-Key

Ultimate: U-Key, UK-05

Small GW: SG-04

Small Dropper: SD-05

2

3

4

2-4 Glue the keys together from 3 pieces each, **very accurately**, with the guiding rectangle pieces glued into the slits. **Use LOTS of glue! Press together firmly, so there is no gap between the layers. Ensure that all 3 layers line up perfectly.**

5

5 Ensure no glue is visible anywhere. Wipe it away with slightly wet rag. **Hold together with vice grips or 20 KG weight during glue drying time. Minimal tolerances!** If needed, lightly sand the edges.

Lock the box with proper keys front and back (front ones have little indentations in the top).

The keys should just drop into the holes and **turn without force**.

This get easier with time.

You may round off the corners very slightly with a file to make them fit better.
